proof that every linear operator on a finite-dimensional complex vector space has an eigenvalue. The book starts by discussing vector spaces, linear independence, span, basics, and dimension. Students are introduced to inner-product spaces in the first half of the book and shortly thereafter to the finite-

dimensional spectral theorem. A variety of interesting exercises in each chapter helps students understand and manipulate the objects of linear algebra. This second edition features new chapters on diagonal matrices, on linear functionals and adjoints, and on the spectral theorem; some sections, such as those

on self-adjoint and normal operators, have been entirely rewritten; and hundreds of minor improvements have been made throughout the text.

This is a short text in linear algebra, intended for a one-term course. In the first chapter, Lang discusses the relation between the

geometry and the algebra underlying the subject, and gives concrete examples of the notions which appear later in the book. He then starts with a discussion of linear equations, matrices and Gaussian elimination, and proceeds to discuss vector spaces, linear maps, scalar products, determinants, and

eigenvalues. The book contains a large number of exercises, some of the routine computational type, while others are conceptual.

At last: geometry in an exemplary, accessible and attractive form! The authors emphasise both the intellectually stimulating parts of geometry and routine

large number of completed exercises and I hope that this book, which contains over 600 exercises covering the topics mentioned above, will achieve my goal.

The exercises are an integral part of Lang's book and I encourage the reader to work through all of them. In some cases, the problems in the
