In vector calculus, the derivative of a vector function  $y$  with respect to a vector  $x$  whose components represent a space is known as the pushforward (or differential), or the Jacobian matrix. The pushforward along a vector function  $f$  with respect to vector  $v$  in  $\mathbb{R}^n$  is given by  $d\mathbf{f}(v) = \mathbf{f}'(v) \cdot v$ . 
$$d\mathbf{f}(v) = \frac{\partial \mathbf{f}}{\partial x} v$$

A more extensive account of matrix differential calculus, which relies exclusively on vectorised matrices, was provided by the text of Magnus and Neudecker (1988). This has become a standard reference. More recent accounts of matrix differential calculus have been provided by Turkington (2002) and by Harville (2008).
