The HT-5 power amplifier is a low powered push-pull design which produces the crunch and break-up characteristics of a traditional 100W output stage but at a much lower volume. This is achieved by the use of a 12BH7 dual triode in push-pull configuration producing 5 Watts output, which is rich in valve harmonics and compression.

In recent years the approach towards rib fractures has evolved. Abandoned in the past, due to inadequate instrumentation and lack of evidence, rib fixation has recently re-emerged as a treatment option for trauma patients. There have been a number of advances over the last 25 years that now allow surgeons to internally fix rib fractures that otherwise may have not had other options. However, as a result there has been a rapid increase in literature and many institutions interested in initiating rib fixation programs. Due to a variety of practitioners involved namely, trauma surgeons, orthopedic surgeons, and thoracic surgeons there has been no comprehensive guide to patient selection, technique, and post-operative care. The purpose of this text is to fill the educational gap for those trauma, orthopedic, and thoracic surgeons interested in learning the cutting edge evidence-based approaches to treatment of rib fractures. This topic has caught the interest of many and has been a recurrent theme at surgical meetings over the last two years. Although there has been ever increasing levels of interest and experience nationally there are many questions which remain. This text will provide not only the theoretical background for improving outcomes in those with rib fractures but also serve as a practical guide to those interested in starting new programs. The text will include tips and tricks that can be used in the OR or at the bedside to improve patient care. Therefore, the focus will be on a comprehensive review but also including tips and tricks from the most experienced surgeons around the country who are performing internal fixation for rib fractures.

Artificial intelligence (AI) is regarded as the science and technology for producing an intelligent machine, particularly, an intelligent computer program. Machine learning is an approach to realizing AI comprising a collection of statistical algorithms, of which deep learning is one such example. Due to the rapid development of computer technology, AI has been actively explored for a variety of academic and practical purposes in the context of financial markets. This book focuses on the broad topic of "AI and Financial Markets", and includes novel research associated with this topic. The book includes contributions on the application of machine learning, agent-based artificial market simulation, and other related skills to the analysis of various aspects of financial markets.

A complete starting package for students and researchers of the earth science community interested in numerical modeling of microstructures. This excellent book deals with the numerical simulation of such microstructures in rocks. It starts with an introduction to existing methods and techniques for optical and electron microscopic analysis. The main part of the book contains examples of numerical modeling of processes and microstructures in rocks, using the software package "ELLE".

This book covers both basic scientific and clinically relevant aspects of dental composite materials with a view to meeting the needs of researchers and practitioners. Following an introduction on their development, the composition of contemporary composites is analyzed. A chapter on polymerization explains the setting reactions and light sources available for light-cured composites. The quality of monomer-to-polymer conversion is a key factor for material properties. Polymerization shrinkage along with the associated stress remains among the most challenging issues regarding composite restorations. A new classification of dental composites is proposed to offer more clinically relevant ways of differentiating between commercially available materials. A review of specific types of composites provides an insight into their key issues. The potential biological issues of dental composites are reviewed in chapters on elution of leachable substances and cariogenicity of resin monomers. Clinical sections focus on material placement, finishing procedures, and the esthetics and clinical longevity of composite restorations. Bonding to tooth tissues is addressed in a separate chapter, as is the efficiency of various composite repair methods. The final chapter discusses future perspectives on dental composite materials.

This long-anticipated monograph honoring scientist and teacher Fred Sanders includes 16 articles by various authors as well as dozens of unique photographs evoking Fred's character and the vitality of the scientific community he helped develop through his work. Editors Lance F. Bosart (University at Albany/SUNY) and Howard B. Bluestein (University of Oklahoma at Norman) have brought together contributions from luminary authors—including Kerry Emanuel, Robert Burpee, Edward Kessler, and Louis Uccellini—to honor Fred's work in the fields of forecasting, weather analysis, synoptic meteorology, and climatology. The result is a significant volume of work that represents a lasting record of Fred Sanders' influence on atmospheric science and legacy of teaching.

Over two thousand archaeological features cut directly into the limestone bedrock, and an artefact assemblage of pottery, shell and stone led to reconstructions of fifty domestic structures, thirty of which are houses, and interpretations of the spatial organization and chronology of the site between ca. AD 800 and 1504. --

Fender Amps is the first book to chronicle this company's amazing contribution to the amplifier, providing a complete overview of its history and operation. From the K & F amp of 1945 to the Custom Amp Shop line of today, you'll understand why musicians continue to collect, rely and relish the sound of a Fender amplifier.

This book presents the scientific principles, processing conditions, probable failure mechanisms, and a description of reliability performance and equipment required for implementing high-temperature and lead-free die attach materials. In particular, it addresses the use of solder alloys, silver and copper sintering, and transient liquid-phase sintering. While different solder alloys have been used widely in the microelectronics industry, the implementation of sintering silver and transient liquid-phase sintering remains limited to a handful of companies. Hence, the book devotes many chapters to sintering technologies, while simultaneously providing only a cursory coverage of the more widespread techniques employing solder alloys. Addresses the differences between sintering and soldering (the current die-attach technologies), thereby comprehensively addressing principles, methods, and performance of these high-temperature die-attach materials; Emphasizes the industrial perspective, with chapters written by engineers who have hands-on experience using these technologies; Baker Hughes, Bosch and ON Semiconductor, are represented as well as materials suppliers such as Indium; Simultaneously provides the detailed science underlying these technologies by leading academic researchers in the field.

Hydrological processes in forested watersheds are influenced by environmental, physiological, and biometric factors such as precipitation, radiation, temperature, species type, leaf area, and extent and structure of forest ecosystems. Over the past two centuries, forest coverage and forest structures have been impacted globally by anthropogenic activities, for example, forest harvesting, and conversion of forested landscapes for plantations and urbanization. In addition, since the industrial revolution, climate change has resulted in profound impacts on forest ecosystems due to higher carbon dioxide (CO₂) concentration or CO₂ fertilization, warmer temperatures, changes in frequency and intensity of extreme weather events and natural disturbances. As a result, hydrological processes in forested watersheds have been altered by these natural and anthropogenic factors and these changes are expected to accelerate due to future changing climatic conditions. Hence, understanding how various environmental, physiological, and physical drivers interactively influence hydrological and biogeochemical processes in forest ecosystems is critical for sustainable water supply in forested watersheds. About 21% of the global population depends on water sources that originate in forested catchments where forest coverage larger than 30%. Furthermore, there are knowledge gaps in our understanding of the mechanism of hydrological and hydrochemical cycles in forested watersheds. This Special Issue addresses these gaps in our knowledge and includes twelve papers in the following three major research themes in forest watershed areas.
