PLCs are complex and powerful computers. But, we can describe the function of a PLC in simple terms. The PLC takes inputs, performs logic on the inputs in the CPU and then turns on or off outputs based on that logic. We will get into more detail later but for now, think of it like this:

A Beginner's PLC Overview, Part 1 of 4: Introduction to PLCs

The device mentioned above is known as a Programmable Logic Controller or PLC for short and the software that enables this virtual circuit building is known as Ladder Logic or Ladder Diagram. PLC's together with Ladder logic has transformed the industrial automation industry.

A Simple (But Complete) Guide : PLC Ladder Logic ...

Since a PLC is a computer, it stores information in the form of On or Off conditions (1 or 0), referred to as binary digits (bits). Sometimes binary digits are used individually and sometimes they are used to represent numerical values. Decimal System Various number systems are used by PLCs.

Basics of PLCs

A PLC (Programmable Logic Controllers) is an industrial computer used to monitor inputs, and depending upon their state make decisions based on its program or logic, to control (turn on/off) its outputs to automate a machine or a process. NEMA defines a PROGRAMMABLE LOGIC CONTROLLER as:

PLC - Definitions: A programmable logic controller is a digitally operated electronic system. It is designed for use in an industrial environment. It uses a programmable memory for the internal storage of user oriented instructions for implementing specific functions such as logic sequencing, timing, counting and arithmetic to control etc.

Introduction to Programmable Logic Controllers (PLC's)

The purpose of a PLC was to directly replace electromechanical relays as logic elements, substituting instead a solid-state digital computer with a stored program, able to emulate the interconnection of many relays to perform certain logical tasks.

Ladder logic (also known as ladder diagram or LD) is a programming language used to program a PLC (Programmable Logic Controller). It is a graphical PLC programming language which expresses logic operations with symbolic notation. Ladder logic is made out of rungs of logic, forming what looks like a ladder - hence the name 'Ladder Logic'.

Different PLC Relays. PLCs have solved the problem brought by relays, and it was thanks to the software-based relays that were designed for the PLC. These relays now only rely on the memory component of the PLC so instead of actually using relays to create a connection point, the memory of the PLC now only stores the states of the supposed relays.

PLC programming is a logical procedure In a PLC program, “things” (inputs and rungs) are either TRUE or FALSE If the proper input conditions are TRUE: The rung becomes TRUE and an output action occurs (for example, a motor turns on) If the proper input conditions are not TRUE: The rung becomes FALSE and an output action does not occur
